02-FEB-1999;

WPI; 2000-532892/48. P-PSDB; AAY97150.

Novel pigment protein derived from corals capable of emitting fluorescence upon irradiation by incident light useful as tissue marker, fluorescent marker or general dyestuff.

Claim 10; Page 44; 49pp; English.

cDNA libraries were constructed from a blue pigmented coral, Acropora aspera to isolate sequences encoding polypeptides with N-terminal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       840
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             600
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                720
Sequences as shown in AAY97147-46. Pigment protein from coral tissue (PPCT) is capable of entiting fluorescence upon irradiation by incident light whose maximal absorbance is in the range of 320-600 nm and a maximal fluorescence emission is in the range of 300-700 nm. PPCT may be used as a tissue marker, fluorescent marker (e.g. to follow gene expression in transformed tissues) or general dysetuff (all claimed).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cDNA libraries were constructed from a blue pigmented coral, Acropora aspera to isolate sequences encoding polypeptides with N-terminal sequences as shown in AAY97147-48. Pigment protein from coral tissue (PPCT) is capable of emitting fluorescence upon irradiation by incident light whose maximal absorbance is in the range of 320-600 nm and a maximal fluorescence emission is in the range of 300-700 nm. PPCT may be used as a tissue marker, fluorescent marker (e.g. to follow gene expression in transformed tissues) or general dysetuff (all claimed). PPCT may also be used in sunscreen formulations or UV filters (both
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      09
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel pigment protein derived from corals capable of emitting fluorescence upon irradiation by incident light useful as tissue marker, fluorescent marker or general dyestuff.

The invention relates to an isolated colour-facilitating molecule (CFM)

comprising a polypeptide which, in a cell, alone or together with one or

more other molecules imparts an altered visual characteristic to the cell

when visualised by a human eye in the absence of excitation by extraneous

con-white light or particle emission. CFMs are useful for producing a

transgenic animal which exhibits a novel colour e.g. sheep with blue or

red coloured fleece. They are useful for producing coloured plant

extracts, e.g. flavouring, beverage or juice or colouring agent. Other

cuses include transducing or intensifying an image, providing additional

colight for growing photorropic organisms e.g. algae and/or corals, for

coating materials that experience UV damage e.g. plastics and car

cupholstery. CFMs are useful in the flower industry, in the development of

the warieties of flowering plants. Other contemplated uses include,

expression markers, general reporter molecules, photon traps, UV sinks or

conting species, and in fruits and vegetables to enhance their

cupholity. CFMs embedded in a gel matrix improve image quality in

situations of distorted light specira (Diomatrix). The first all-protein

chromophore to be isolated was Green Fluorescent protein (GFP). The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   240

transgenic animal which exhibits a novel colour e.g. sheep with blue or red coloured fleece. They are useful for producing coloured plant cattacts, e.g. fleavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include, expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs modify visible colour in edible and/or ornamental fungal species, and in fruits and vegetables to enhance their marketability. CFMs embedded in a gel matrix improve image quality in situations of distorted light species (biomatrix). The first all-protein chromophore to be isolated was Green Fluorescent protein (GFP). The sequences given in records ABZ12068-ABZ12195 represent CFM related DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           180

The invention relates to an isolated colour-facilitating molecule (CFM) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous non-white light or particle emission. CFMs are useful for producing a transgenic animal which exhibits a novel colour e.g. sheep with blue or red coloured fleece. They are useful for producing coloured plant extracts, e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for coalting materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CPMs modify visible colour in edible and/or ornamental fungal species, and in fruits and vegetables to enhance their marketability. CFMs embedded in a gel matrix improve image quality in situations of distorted light spectra (biomatrix). The first all-protein chromophore to be isolated was Green Fluorescent protein (GFP). The sequences given in records ABZ12068-ABZ12195 represent CFM related DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel color-facilitating molecule for producing a biomatrix, has a polypeptide which alone/along with molecules imparts altered visual characteristics to cells in the absence of excitation by extraneous non-

The invention relates to an isolated colour-facilitating molecule (CFW)

Comprising a polypeptide which, in a cell, alone or together with one or

more other molecules imparts an altered visual characteristic to the cell

when visualised by a human eye in the absence of excitation by extraneous

con-white light or particle emission. CFMs are useful for producing a

transgenic animal which exhibits a novel colour e.g. Sheep with blue or

red coloured fleece. They are useful for producing coloured plant

cost include transducing or intensifying an image, providing additional

light for growing phototropic organisms e.g. algae and/or corals, for

uses include transducing or intensifying an image, providing additional

light for growing phototropic organisms e.g. algae and/or corals, for

upholstery. CFMs are useful in the flower industry, in the development of

new varieties of flowering plants. Other contemplated uses include,

expression markers, general reporter molecules, photon traps, UV sinks or

in sunscreens. CFMs embedded in a gel marrix improve image quality in

situations of distorted light spectra (blomatrix). The first all-procein

chromophore to be isolated was Green Fluorescent Erotein (GFP). The

sequences given in records ABZ12068-ABZ12195 represent CFM related DNA
                                                                                                                                         Novel color-facilitating molecule for producing a biomatrix, has a polypeptide which alone/along with molecules imparts altered visual characteristics to cells in the absence of excitation by extraneous non-

The inventor interacts to dan instance of court interacture (view, one other molecules imparts an altered visual characteristic to the cell more other molecules imparts an altered visual characteristic to the cell more other molecules imparts an altered visual characteristic to the cell more other molecules imparts an altered visual characteristic to the cell convention in a cell, and are useful for producing a reason on-white light or particle emission. CFMs are useful for producing a reason of cleece. They are useful for producing coloured plant cat of coloured fleece. They are useful for producing coloured plant cat of coloured fleece. They are useful for producing open. Other cuses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include, new varieties of flowering plants. Other contemplated uses include, in sunscreens. CFMs modify visible colour in edible and/or ornamental fungal species, and in fruits and vegetables to enhance their
                                                                                       009
                                                                                                                            099
                                                                                                                                                Novel color-facilitating molecule for producing a biomatrix, has a polypoptide which alone/along with molecules imparts altered visual characteristics to cells in the absence of excitation by extraneous non-white light.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated colour-facilitating molecule (CFM)

marketability. CFMs embedded in a gel matrix improve image quality in situations of distorted light spectra (biomatrix). The first all-protein chromophore to be isolated was Green Fluorescent protein (GFP). The sequences given in records AB212068-AB212195 represent CFM related DNA sequences. (Updated on 07-AUG-2003 to correct OS field.)

The invention relates to an isolated colour-facilitating molecule (CFM) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous con-white light or particle emission. CFMs are useful for producing a transgenic animal which exhibits a novel colour e.g. sheep with blue or ced coloured fleece. They are useful for producing or transgenic animal whore transducing or intensifying an image, providing agent. Other extracts, e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional light for growing photoropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include, cypression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs modify visible colour in edible and/or cornamental constructions of distorted light spectra (bromatrix). The first all-protein chromophore to be isolated was Green Fluorescent protein (GFP). The sequences given in records ABZ12068-ABZ12195 represent CFM related DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     180

when visualised by a human eye in the absence of excitation by extraneous non-white light or particle emission. CFMs are useful for producing a transpanic animal which exhibits a novel colour e.g. sheep with blue or red coloured fleece. They are useful for producing coloured plant coverses. e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car. Upholstery. CFMs are useful in the flower industry, in the development of coating markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs modify visible colour in edible and/or ornamental comparate species, and in fruits and vegetables to enhance their marketability. CFMs embedded in a gel matrix improve image quality in cituations of distorted light spectra (biomatrix). The first all-protein chromophore to be isolated was Green Fluorescent protein (GFP). The

cell

The invention relates to an isolated colour-facilitating molecule (CFM) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell

Example 12; Page 482-483; 510pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an isolated colour-facilitating molecule (CEM)

comprising a polypeptide which, in a cell, alone or together with one or

more other molecules imparts an altered visual characteristic to the cell

when visualised by a human eye in the absence of excitation by extraneous

non-white light or particle emission. CFMs are useful for producing a

transgenic animal whichs exhibits a novel colour e.g. sheep with blue or

red coloured fleece. They are useful for producing coloured plant

cextracts, e.g. flavouring, beverage or juice or colouring agent. Other

extracts, e.g. flavouring beverage or juice or colouring agent. Other

costing materials that experience UV damage e.g. plastics and car

light for growing phototropic organisms e.g. algae and/or corals, for

coating materials that experience UV damage e.g. plastics and car

conting materials that experience to their contemplated uses include,

conting maxers, general reporter molecules, photon traps, UV sinks or

my surjeties of flowering plants. Other contemplated uses include,

expression maxers, general reporter molecules, photon traps, UV sinks or

contemplated maxers, general reporter molecules, photon traps, UV sinks or

my species, and in fruits and vegetables to enhance their

maxetablity. CFMs embedded in a gel matrix improve image quality in

situations of distorted light spectra (biomatrix). The first all-protein

chromophore to be isolated was Green Fluorescent protein (GFP). The

sequences given in records ABZ12068-BAZ12195 represent CFM related DNA

sequences. (Updated on 07-AUG-2003 to correct OS field.)

The invention relates to an isolated colour-facilitating molecule (CFM)

comprising a polypeptide which, in a cell, alone or together with one or

more other molecules imparts an altered visual characteristic to the cell

when visualised by a human eye in the absence of excitation by extraneous

non-white light or particle emission. CFMs are useful for producing a

transgenic animal which exhibits a novel colour e.g. sheep with blue or

red coloured fleece. They are useful for producing coloured plant

extracts, e.g. flavouring, beverage or juice or colouring agent. Other

uses include transducing or intensifying an image, providing additional

light for growing phototropic organisms e.g. algae and/or corals, for

coating materials that experience UV damage e.g. plastics and car

upholstery. CFMs are useful in the flower industry, in the development of

coating markers, general reporter molecules, photon traps, UV sinks or

the warketass of flowering plants. Other contemplated uses include,

expression markers, general reporter molecules, photon traps, UV sinks or

in sunscreens. CFMs modify visible colour in edible and/or ornamental

considerability. CFMs embedded in a gel matrix improve image quality in

situations of distorted light spectra (blomatrix). The first all-protein

chromophore to be isolated was Green Fluorescent protein (GFP). The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       240

The invention relates to an isolated colour-facilitating molecule (CFM) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous con-white light or particle emission. CFMs are useful for producing a curansgenic animal which exhibits a novel colour e.g. sheep with blue or red coloured fleece. They are useful for producing coloured plant extracts, e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional light for growing photortopic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of coating materials that experience UV damage e.g. plastics and car upholstery. CFMs modify visible colour in edible and/or ornamental commarkers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs modify visible colour in edible and/or ornamental control protein of distorted light species (biomatrix). The first all-protein chromophore to be isolated was Green Fluorescent protein (GFP). The invention relates to an isolated colour-facilitating molecule (CFM) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous non-white light or particle emission. CFMs are useful for producing a transgenic animal which exhibits a novel colour e.g. sheep with blue or red coloured fleece. They are useful for producing coloured plant extracts, e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for coaling materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs modify visible colour in edible and/or ornamental fungal species, and in fruits and vegetables to enhance their marketability. CFMs embedded in a gel matrix improve image quality in situations of distorted light spectra (biomatrix). The first all-protein chromophore to be isolated was Green Fluorescent protein (GFP). The sequences given in records ABZ12068-ABZ12195 represent CFM related DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated colour-facilitating molecule (CFM) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous non-white light or particle emission. CFMs are useful for producing a transgenic animal which exhibits a novel colour e.g. sheep with blue or
                                                                                                                                                                                                                                                                                                   663
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    -uou

extracts, e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing, beverage or juice or colouring agent. Other uses include transducing or intensitying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include, expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs embedded in a gel matrix improve image quality in marketability. CFMs embedded in a gel matrix improve image quality in chicumphore to be isolated was Green Fluorescent protein (GFP). The sequences given in records ABZ12068-ABZ12195 represent CFM related DNA

The invention relates to an isolated colour-facilitating molecule (CFM)

comprising a polypeptide which, in a cell, alone or together with one or

more other molecules imparts an altered visual characteristic to the cell

when visualised by a human eye in the absence of excitation by extraneous

non-white light or particle emission. CFMs are useful for producing a

transgenic animal which exhibits a novel colour e.g. sheep with blue or

red coloured fleece. They are useful for producing coloured plant

extracts, e.g. flavouring, beverage or juice or colouring agent. Other

uses include transducing or intensifying an image, providing additional

light for growing phototropic organisms e.g. algae and/or corals, for

coating materials that experience W damage e.g. plastics and car

upholstery. CFMs are useful in the flower industry, in the development of

the wortheries of flowering plants. Other contemplated uses include,

expression markers, general reporter molecules, photon traps, UV sinks or

in sunscreens. CFMs modify visible colour in edible and/or ornamental

fungal species, and in fruits and vegetables to enhance their

marketability. CFMs embedded in a gel matrix improve image quality in

situations of distorted light spectra (biomatrix). The first all-protein

chromophore to be isolated was green Fluorescent protein (GFP). The
